

# HYPOTHYROIDISM

## REFERRAL GUIDELINE

Maine Medical Partners - Endocrinology & Diabetes Center · 175 US Route One, Scarborough, ME · (207) 396-7700

HIGH RISK	MODERATE RISK	LOW RISK
SUGGESTED EMERGENT CONSULTATION	SUGGESTED CONSULTATION OR CO-MANAGEMENT	SUGGESTED ROUTINE CARE
<b>SYMPTOMS AND LABS</b> Profoundly elevated TSH (>50)  Swelling, hypotension, hypothermia, mental status changes (consider hospitalization)  Exacerbation of other health conditions	<b>SYMPTOMS AND LABS</b> Elevated TSH (>20 - <50)  Symptoms interfering with life or aggravating other health conditions  On therapy, TSH not normal after several adjustments	<b>SYMPTOMS AND LABS</b> TSH (0.270 - 20)  Fatigue, cold intolerance, constipation, depression, other mild or nonspecific symptoms  On therapy, normal TSH but persistent symptoms
<b>SUGGESTED PREVISIT WORKUP</b>  Need to know is this a new dx or long standing diagnosis?  If referring to Endocrinology & Diabetes, please provide full lab report for TSH and Free T <sub>4</sub>  Is the patient on therapy? What therapy?  ? Recent change in symptoms or control  Start levothyroxine therapy in most cases 1.6-1.8 mcg/kg or call us for an initial recommendation	<b>SUGGESTED WORKUP</b>  If referring to Endocrinology & Diabetes, please provide full lab report for TSH and Free T <sub>4</sub>  Detailed medication history if on therapy  Make sure patient is taking medication the same way every day, not missing doses  Consider poor absorption if on therapy	<b>SUGGESTED MANAGEMENT</b>  Levothyroxine therapy if TSH is high  If TSH is only minimally elevated (< 8) and patient feeling well, reasonable to observe off therapy. TSH periodically  If TSH is above 8 or FT <sub>4</sub> is low, we do suggest levothyroxine therapy  Monitor therapy with TSH 6-8 weeks after starting therapy or after any dose adjustment

### CLINICAL PEARLS

- Commonly due to autoimmune thyroiditis (Hashimotos) that causes primary hypothyroidism. Very common in the general population and in people with personal or family history of other autoimmune disorders.
- Other causes: surgery, I-131 therapy, radiation, idiopathic, central/secondary hypothyroidism (uncommon)
- Sometimes TPO antibodies or Tg antibodies are helpful to diagnose Hashimotos.
- Although thyroxine is best taken on an empty stomach in the morning, consistent dosing is most important. It should be taken at least 3-4 hours away from a calcium or iron supplement. Missed doses should be taken as soon as possible.
- It is helpful to have initial data and treatment history, including any adjustment. A year’s worth of data is helpful if there’s been a lot of change.
- An Ultrasound is not necessary unless there is a palpable abnormality. However, if the patient has had an US please send us this data.
